Services (Mapped Services — DEV Access)

Service	Errors	Warnings	Service Requests	P99 Latency (ms)
log-controller-service	7	2	0	—

System Health Overview

501	7	2	492	HEALTHY
Total Logs	Errors	Warnings	Info	Overall Status

Key Insights

■ Elevated Error Rate

Error rate is 1.4% (7/501 logs) — above the 1% caution threshold. Monitor closely.

■ Dominant Error Pattern

'GET /api/services — user='thani.k1527@gmail.com' role=DEV returnedServ' accounts for 57% of all errors (4 occurrences). Resolving this single error type would eliminate the majority of error volume.

Top Errors (by Frequency)

#	Error Message	Service	Category	Count	% of Total
1	GET /api/services — user='thani.k1527@gmail....	log-controller-service	Application	4	57.1%
2	GET /api/services — user='thaniyarasik@gmail...	log-controller-service	Application	2	28.6%
3	Aggregated 19 earlier error logs	log-controller-service	Application	1	14.3%

■ Analysis Visualisations

Recommendations & Fixes

MEDIUM

1. GET /api/services — user='thani.k1527@gmail.com' role=DEV returne [\[log-controller-service\]](#) (4 occurrences)

Why it happened: Application-level error — exact root cause requires log inspection to identify the originating module.

How to fix:

- 1 Search for the full stack trace of 'GET /api/services — user='thani.k1527@gmail.com' role=D' in the log management system.
- 2 Identify the service, class, and method that originates this error.
- 3 Determine if the error is transient (add retry with exponential back-off) or deterministic (fix the root cause directly).
- 4 Add a targeted alert rule so future occurrences are flagged immediately.

MEDIUM

2. GET /api/services — user='thaniyarasik@gmail.com' role=ADMIN retu [log-controller-service] (2 occurrences)

Why it happened: Application-level error — exact root cause requires log inspection to identify the originating module.

How to fix:

- 1 Search for the full stack trace of 'GET /api/services — user='thaniyarasik@gmail.com' role=' in the log management system.
- 2 Identify the service, class, and method that originates this error.
- 3 Determine if the error is transient (add retry with exponential back-off) or deterministic (fix the root cause directly).
- 4 Add a targeted alert rule so future occurrences are flagged immediately.

HIGH

3. Aggregated 19 earlier error logs [log-controller-service] (1 occurrences)

Why it happened: The log-controller-service batched a large number of historical entries into a single event — typically caused by a log pipeline restart or catch-up flush after a service crash or rolling restart.

How to fix:

- 1 Cross-reference the timestamp with recent deployments, pod restarts, or crash events: `kubectl describe pod`.
- 2 Check log-controller-service buffer config (`max_buffer_size`, `flush_interval`) — large buffers produce bulk flushes on restart.
- 3 Review container restart history to confirm whether a crash triggered the flush.
- 4 If recurring, reduce the buffer window or migrate to a real-time log shipper (Fluentd / Logstash) to avoid batching.

LOW

4. Operational Recommendation

How to fix:

- 1 Inspect recent log-controller-service deploys, dependencies, and retries if its error count keeps rising.

LOW

5. Operational Recommendation

How to fix:

- 1 Correlate the top error message with infrastructure changes and upstream service failures.
